

HARSHIT CHORDIYA

Software Engineer | Agentic AI, Prototyping & Automation

Melbourne 3183, Australia | 0494387182 | hchordiya6@gmail.com | [LinkedIn](#) | [Github](#) | harshitchordiya.com
Work Rights: Temporary Graduate Visa (subclass 485) — full, unrestricted working rights

PROFESSIONAL SUMMARY

Software engineer who builds and stress-tests agentic AI systems in live client environments. Over the past year I have taken ambiguous business problems across government, not-for-profit and enterprise settings and turned them into working AI agents, LLM-powered workflows and automation prototypes — owning the arc from stakeholder discovery through prompt and architecture experimentation to evaluation and handover. Python-first, with solid engineering fundamentals and most value added in fast-moving work where requirements are still forming.

EDUCATION

RMIT University

Feb 2023 — Dec 2025

Bachelor of Computer Science, Melbourne, Australia

KEY SKILLS

Agentic AI & GenAI: AI agent design, agentic workflows, tool use / function calling, prompt engineering & iteration, RAG concepts, LLM output evaluation (accuracy, reliability, consistency), OpenAI API, Claude API, LLM-based document processing, Cursor

Programming & Engineering: Python, TypeScript, JavaScript, Java, C#, C++, React, Next.js, HTML5, Tailwind, Bootstrap, REST API design

Data & Automation: SQL (MySQL, PostgreSQL), Pandas, data cleaning & analysis, OCR pipelines, workflow automation, API integrations, reporting & dashboards

Cloud & DevOps: AWS (EC2, S3, RDS, IAM), Docker, Linux, CI/CD (GitHub Actions)

Discovery & Delivery: Problem framing with business stakeholders, requirements analysis, process mapping, workflow analysis, rapid prototyping, technical documentation, Agile squad delivery

PROFESSIONAL EXPERIENCE

AI Automation & Software Engineering Contractor, Bosley

April 2026 — Present

Melbourne, Australia

Bosley is an Australian technology and consulting company delivering digital transformation, automation, and AI-enabled business solutions across commercial and government client environments.

- Engaged full-time to identify high-value automation and AI opportunities across client business units, then build the prototypes that prove or kill them before delivery commits to a direction.
- Designed and shipped agentic AI workflows combining LLMs (Claude, OpenAI), tool use and enterprise knowledge sources to automate document-heavy processing and knowledge retrieval.
- Ran rapid experiments across prompts, models and agent architectures — comparing approaches, measuring output accuracy and reliability, and discarding what did not hold up under real inputs.
- Worked directly with non-technical stakeholders to convert vague problem statements into scoped, testable solutions, and to set realistic expectations of what current AI can and cannot do reliably.
- Delivered inside government contract environments with requirements around secure workflows and traceability, capturing reusable patterns and handover documentation so proven approaches could be repeated rather than rebuilt.

Software Engineer Intern, Bridge Marketplace

Dec 2024 — Mar 2025

New York, USA (Remote)

Bridge Marketplace is a fintech company which connects businesses with suitable lending partners.

- Built Python automation pipelines to ingest, validate and transform financial data from Excel and CSV sources.
- Developed OCR-based workflows to extract structure from unstructured lending documents, then integrated OpenAI APIs to interpret and organise the extracted content into machine-readable outputs.
- Investigated and resolved pipeline failures against messy real-world inputs, improving data reliability and removing manual processing effort from the workflow.

Software Developer, RISC at RMIT University

Apr 2024 — Dec 2024

Melbourne, Australia

RISC is a student-led technical club at RMIT University focused on cybersecurity and hands-on projects.

- Developed and maintained internal systems and tools within Agile teams, contributing API integrations, debugging and performance improvements across iterative releases.

PROJECTS

Guide Dogs Victoria: AI Agents & Client Portal

Professional Project through Bosley

- Designed and built three AI agents and an AI-enabled client portal supporting knowledge retrieval, guided assistance and workflow automation. Owned prompt design, tool integration and iterative evaluation of agent responses against real user queries, refining behaviour until output was consistent enough for end users.

Tech Stack: AI Agents, LLMs, Claude, OpenAI, Prompt Engineering, Tool Use, RAG Concepts, Workflow Automation, Client Portal

Gunner: Workday Implementation Support

Professional Project through Bosley

- Supporting an enterprise Workday implementation through current-state process mapping, workflow analysis and identification of AI and automation opportunities — the discovery work that determines what is worth building before anything is built.

Tech Stack: Workday, Process Mapping, Documentation, Workflow Analysis, AI Automation, Stakeholder Support

TidyLens: Mixed Reality Inventory Tracking

- Built an end-to-end application integrating Unity (C#) with Python/Flask backend services and a YOLOv5 detection model
- Designed REST APIs for real-time data exchange and persistence, with structured SQL database models for inventory and tracking data
- Deployed backend services on a Linux server and optimised performance (≈90% lag reduction)

Tech stack: Unity, C#, Python, Flask, REST, YOLOv5, MySQL, Linux, Deployment

Purchase Order Scorecard Dashboard

- Built Python/Pandas data pipelines to clean, validate, and aggregate purchase order and invoice datasets, producing dashboard-ready KPI reports with documented assumptions and edge cases.

Tech stack: Python, Pandas, Dash, Excel/CSV, OCR
